SIGNRACER 1600 H-LED and SIGNRACER 2512 LED at FESPA 2015

SIGNRACER GmbH will present the new hybrid UV printer series at Fespa 2015 in Cologne. The SIGNRACER 1600 H-LED is equipped for role to role printing and can also be used to print on rigid materials. The second printer being exhibited is the flatbed printer SIGNRACER 2512 LED.

The SIGNRACER 1600 H-LED will be presented with the Amethyst SR-100 inks. This ink was officially released by Ricoh and is a multi-purpose ink for flexible and rigid materials. The SR-100 has a hard surface with good scratch resistance and also a good adhesion for most materials.

The SIGNRACER 2512 LED will be presented with the new Amethyst SRX-200 inks. This ink was developed to meet future legal requirements. The ink has the best adhesion on different materials and can be used without any primer. For specific outdoor applications on glass, SIGNRACER offers a pre-treatment set called Sigtreat. The pre-treatment makes the UV ink water resistant, when printed on glass. Amethyst SRX-200 inks are also very flexible when the substrate is heated. Very good thermo formable results can be achieved.
