

SIGNRACER NEWS 03-2019

SIGNRACER offers new Anti-Static system for UV printer

Based on requests from the market Signracer has developed a new high-end anti-static system, which is integrated into a new LED housing. The anti-static system is using two 24 cm electrodes from the German company Kersten, which are located between the LED system and the carriage. This position is ideal to reduce static as close as possible to the print heads. For cleaning customers can easily access the electrodes.

For the introduction of the new anti-static system, the whole LED housing was redesigned. The LED is now in a straight position to increase the LED performance. In addition, we have added a filter on the side of the housing to protect the LED heads from contamination with inks.

The new Anti-Static system will be presented at Fespa Munich in May 2019, but can already be ordered now.
