

## **SIGNRACER NEWS 04-2019**

**Together with our Italian distributor Errelle, SIGNRACER presents UV and water based printers at Viscom 2019 in Milan. Visit us in hall 8 at stand H39/40 (10.-12.of October)**

The highlight at Viscom will be the presentation of our new water-based solutions. Signracer will exhibit the further improved Signracer Hydrospeed+ with our new industrial heaters to have a 100% water resistance for outdoor billboard applications. With the new heaters, we can print with top speed of 340 m<sup>2</sup>/h. In addition, we have developed wallpapers printed with our pigmented water based inks. The ink has no smell and is therefore ideal for indoor applications as well. The high pigment loading results in vibrant colours for every design purpose.

The second brand new product line is the Signracer TEX with dye sublimations inks. At Viscom, we present the standard Signracer TEX printer with two print heads. To demonstrate the brilliant and vibrant colours the papers are transferred with a heat press.

In addition, we exhibit several UV printer. The Signracer 1610 HB is using a higher bridge to print on media up to 25 cm height. This concept can be used for special industrial applications, like printing on shoes or furniture.

The largest UV flatbed Signracer 3020 was optimized for high-speed applications. This printer has a symmetrical print head configuration, a High-Tech linear motor and Kyocera print heads. The new linear motor technology allows a much higher carriage speed of 1.5 m/s compared to 1.0 m/s for the belt systems. In addition to the much higher productivity, the acceleration of the carriage is faster and there is much less vibration and noise.

The third UV printer is the new Signracer 1600 with Kyocera print heads. This small hybrid achieves with Kyocera print heads almost double the speed due to the double length of the heads.
